

# kaufmann\_kennzahlen

## Change of Data Source

Please follow the below steps:

- Create directory name data under the assets folder.
- Drag & drop the data.json file from the zip which I provided.

- Add one line (assets/data/) to get the data.json file from assets in pubspec.yaml file.

```
1  assets:
2    - assets/happy.gif
3    - assets/images/
4    - assets/data/
```

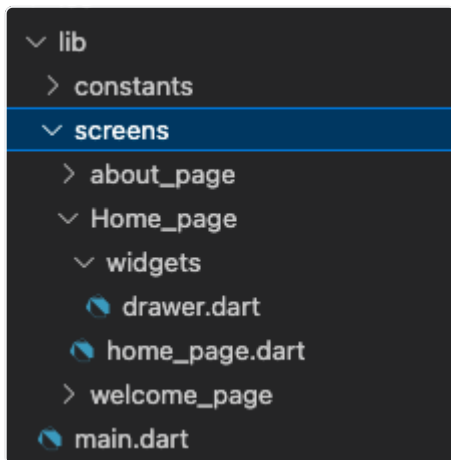

```
# To add assets to your application, add an assets section, like this:
assets:
  - assets/happy.gif
  - assets/images/
  - assets/data/
```

- After then click the down arrow to get packages in pubspec.yaml (it will get data.json from the assets folder)

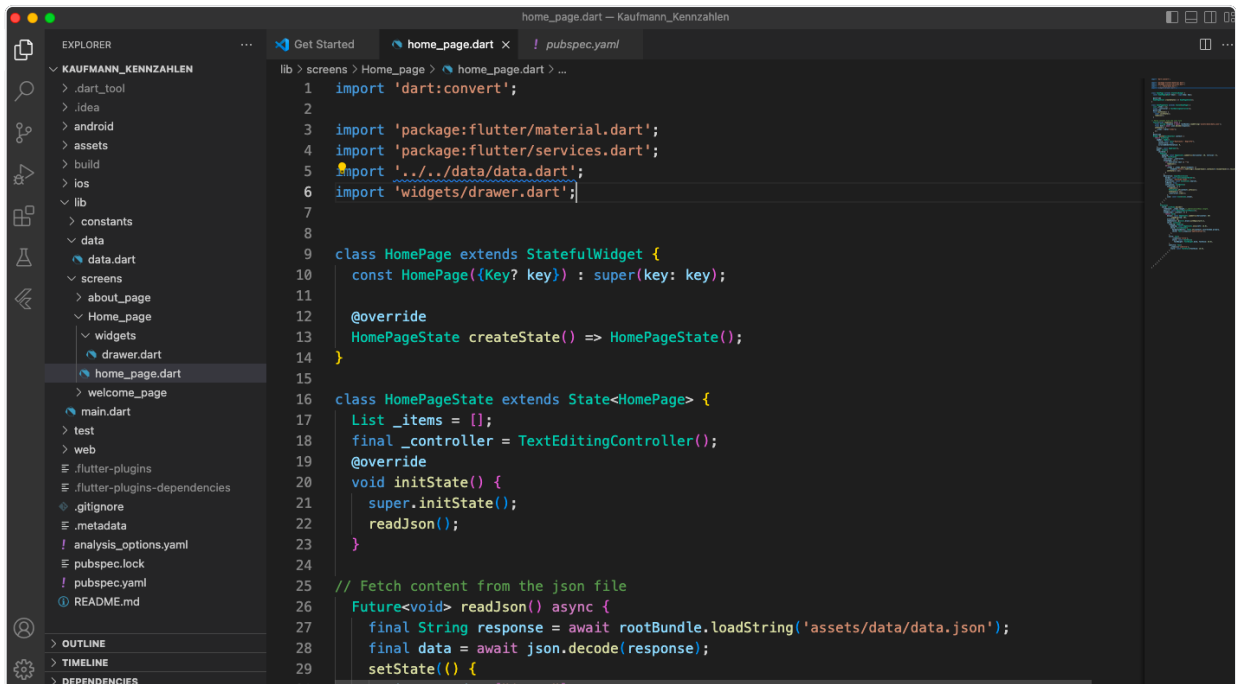

- Remove the data directory from the lib folder.

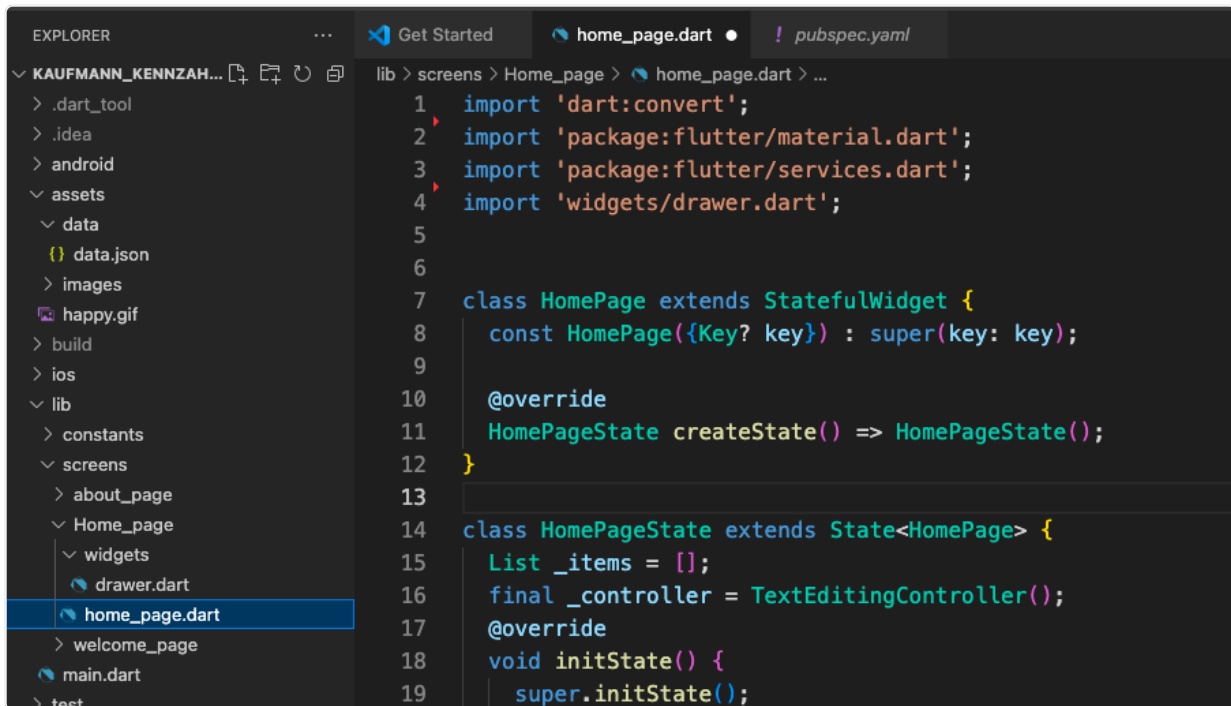

## home\_page.dart

- Remove unnecessary library which is not used in the home\_page.dart.

- Add `_items` variable in the `home_page.dart` file.

```
1 List _items = [];
```

```
class HomePageState extends State<HomePage> {
  List _items = [];
  final _controller = TextEditingController();
```

- Add `readJson()` function in the `home_page.dart` file.
- Call this function in the `initState()` function.

```
1 @override
2 void initState() {
3   super.initState();
4   readJson();
5 }
6
7 // Fetch content from the json file
8 Future<void> readJson() async {
9   final String response = await
    rootBundle.loadString('assets/data/data.json');
10   final data = await json.decode(response);
11   setState(() {
```

```

12     _items = data["items"];
13   });
14 }

```

```

class HomePageState extends State<HomePage> {
  List _items = [];
  final _controller = TextEditingController();
  @override
  void initState() {
    super.initState();
    readJson();
  }

  // Fetch content from the json file
  Future<void> readJson() async {
    final String response = await rootBundle.loadString('assets/data/data.json');
    final data = await json.decode(response);
    setState(() {
      _items = data["items"];
    });
  }

  @override
  Widget build(BuildContext context) {
    return Scaffold(
      appBar: AppBar(
        title: const Text("Kaufleute - Begriffe"),
        centerTitle: true,
        scrolledUnderElevation: 0,
      ), // AppBar
      drawer: const AppDrawer(),
      body: Column(

```

- Add search functionality when the user types in the search box. It will return title-matched words and display them in the list.

```

1   onChanged: (t) {
2       if(_controller.text == ""){
3           readJson();
4       }else {
5           _items = _items.where((element) =>
6
7               element['title'].toString().toLowerCase().contains(t.toLowerCase
8               ())).toList();
9               setState(() {}));
10          }
11      }

```

```

body: Column(
  children: [
    Padding(
      padding: const EdgeInsets.symmetric(horizontal: 20, vertical: 5),
      child: TextField(
        controller: _controller,
        onChanged: (t) {
          if(_controller.text == ""){
            readJson();
          }else {
            _items = _items.where((element) =>
              element['title'].toString().toLowerCase().contains(t.toLowerCase())).toList
            setState(() {});
          }
        },
        decoration: InputDecoration(
          border: const OutlineInputBorder(),
          hintText: 'Schreibe etwas...',
          prefixIcon: const Icon(Icons.search),
          isDense: true,
          suffixIcon: IconButton(

```

- When the user clicks on the cross button that time data.json file is read again and displays all data from data.json in the list.
- so call readJson() again on onPressed() method.

```

1  onPressed: () {
2      readJson();
3      FocusScope.of(context).unfocus();
4      setState(() {});
5      _controller.clear();
6  },

```

```

suffixIcon: IconButton(
  onPressed: () {
    readJson();
    FocusScope.of(context).unfocus();
    setState(() {});
    _controller.clear();
  },
  icon: const Icon(Icons.close),
), // IconButton

```

- Add \_items.length in the itemCount property of ListView.builder widget.

```

1  itemCount: _items.length,

```

```
Flexible(
  child: ListView.builder(
    itemCount: _items.length,
    physics: const BouncingScrollPhysics(),
    itemBuilder: (context, i) {
      return Card(
        margin: const EdgeInsets.symmetric(horizontal: 20)
          .copyWith(top: 10),
```

- Change CircleAvatar, title & subtitle properties of the ListTile widget with the following code.
- CircleAvatar displays abbreviation, title display title & subtitle display subtitle from the data.json file.

```
1  child: ListTile(
2      leading: Padding(
3          padding: const EdgeInsets.only(left:
4      18.0),
5      child: CircleAvatar(
6          backgroundColor:
7      Theme.of(context).colorScheme.primary,
8      child: Text(_items[i]['abbreviation']),
9      ),
10     title: Text(
11         _items[i]['title'],
12         style: const TextStyle(
13             fontWeight: FontWeight.bold, fontSize:
14         20.0),
15     ),
16     subtitle: Text(
17         _items[i]['subtitle'],
18         style: const TextStyle(fontSize: 16.0),
19     ),
20 ),
```

```

ItemBuilder: (context, i) {
  return Card(
    margin: const EdgeInsets.symmetric(horizontal: 20)
      .copyWith(top: 10),
    elevation: 10,
    shadowColor: Colors.black.withOpacity(0.2),
    child: ListTile(
      leading: Padding(
        padding: const EdgeInsets.only(left: 18.0),
        child: CircleAvatar(
          backgroundColor: Theme.of(context).colorScheme.primary,
          child: Text(_items[i]['abbreviation']),
        ), // CircleAvatar
      ), // Padding
      title: Text(
        _items[i]['title'],
        style: const TextStyle(
          fontWeight: FontWeight.bold, fontSize: 20.0), // TextStyle
      ), // Text
      subtitle: Text(
        _items[i]['subtitle'],
        style: const TextStyle(fontSize: 16.0),
      ), // Text
    ), // ListTile
  ); // Card
}

```
